The nonapeptide can be used in a vaccine to treat a cancerous condition involving HLA-Al subtype cancerous cells. The nucleic acid encoding the nonapeptide can be used as a probe to identify tumour cells. This sequence is homologous to the peptide described and is encoded
R99343-R99350 represent MAGE nonapeptides, based on the tumour rejection antigen region of the full length MAGE sequences. These peptides were used to design the nonapeptides of the invention. (see R99337-R99342), which bind to a HLA molecule on a cell, and provoke lysis by cytolytic Tells (CTLs) specific for a complex of the HLA molecule and nonapeptide. The nonapeptides can be used diagnostically to identify tumours expressing a particular HLA molecule, or to identify cancer cells. The

The peptide sequences may also be used to expand specific CTLs in vitro for later return to the patient, such as for treating melanoma. Tumour cells can be identified by using DNA encoding the nonapeptides as probes. Non-human cells transformed with the HLA-Al gene and a DNA sequence encoding one of the peptides, can be used to generate CTLs, or to detect the presence of CTLs in human samples. The non-human transformed cells, when polytransformed, are universal effector cells, and can be used in vaccines, or for treating melanoma or breast cancer.
                           Y45390 to Y48214 represent specifically claimed immunogenic peptides having a human major histocompatibility complex (MHC) Class I (also known as human leukocyte antigen (HLA)) binding motif. The immunogenic peptides can bind to a specific HLA allele (i.e. HLA-A subtypes HLA-A2.1, A1, A3.2 or A24.1 or HLA-B or C) and induce a cytotoxic T cell response against the antigen from which the peptide is derived. Cytotoxic T lymphocytes (CTLs) which destroy antigen bearing cells are normally induced by an antigen in the form of a peptide fragment bound to a HLA molecule, rather than the intact foreign antigen itself, and
                                                                                                                                                                                                                                                                         WPI;
are particularly important in tumour rejection and in fighting infections. The peptides are therefore useful therapeutically t

They can be administered as vaccines to elicit an immune response in individuals susceptible or otherwise at risk of viral infection or cancer, or used to treat chronic or acute conditions. They are also useful diagnostically, and can be used to induce a cytotoxic T cell response, by contacting a cytotoxic T cell with the peptide e.g. to produce CTLs ex vivo for infusion back into a patient. The polynucleotides encoding the immunogenic peptides are also useful therapeutically and for immunisation as above.
This peptide is a tumour rejection antigen presented by a HLA-B44 molecule and derived from a MAGE-12 tumour rejection antigen precursor (TRAP). Claimed tumour rejection antigens (W2308-43) are able to bind to HLA-B44 positive cells, making them useful in identifying cells which present HLA-B44 molecules on their surfaces for use in the diagnosis and therapy of cellular abnormalities. The complex of the tumour rejection antigen and HLA molecule provokes a cytolytic T cell response. The tumour rejection antigens and HLA-B44, can be used as vaccines to treat disorders characterised by expression of the TRAP molecule such as cancer, especially melanoma. Vaccines can also be prepared from cells which present the tumour rejection antigens and an antigen and the surface can be used as vaccines to treat disorders characterised by expression of the TRAP molecule such as cancer, especially melanoma. Vaccines can also be prepared from cells which present the tumour rejection antigen/HLA complexes on their surface, such
                                                                                                                                                                                                                                                                                   Tumour rejection antigens presented by molecules - useful to identify HLA-B44 and therapy of cellular abnormalities
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Homo sapiens

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    В
       CC r45390 to y48214 represent specifically claimed immunogenic peptides CC having a human major histocompatibility complex (MHC) Class I (also CC known as human leukocyte antigen (HLA)) binding motif. The immunogenic CC peptides can bind to a specific HLA allele (i.e. HLA-A subtypes CC HLA-A2.1, A1, A3.2 or A24.1 or HLA-B-or C) and induce a cytotoxic T cell CC response against the antigen from which the peptide is derived.

CC Cytotoxic T lymphocytes (CTLs) which destroy antigen-bearing cells are CC normally induced by an antigen in the form of a peptide fragment bound CC are particularly important in tumour rejection and in fighting viral CC infections. The peptides are therefore useful therapeutically to treat CC or prevent viral infections and cancers in mammals (especially humans) CC protoxiate cancer, hepatitis B and C. AIDS, and renal carcinoma.

CC They can be administered as vaccines to elicit an immune response in CC individuals susceptible or otherwise at risk of viral infection or CC useful diagnostically, and can be used to induce a cytotoxic T cell CC produce CTLs ex vivo for infusion back into a patient. The peptide e.g. to

No. is the number of results predicted by chance to have a
re greater than or equal to the score of the result being printed,
is derived by analysis of the total score distribution.

A; Description: stimulates mitosis of hepatocytes and other cells
A; Note: does not have proteinase activity
C; Superfamily: hepatocyte growth factor; kringle homology; trypsin homology
C; Keywords: alternative splicing; glycoprotein; growth factor; heterodimer; kringle; pyr
F; 13-1/Domain: signal sequence #status predicted <SIG>
F; 32-494/495-728/Product: hepatocyte growth factor #status experimental <MAT>
F; 32-494/Domain: alpha chain #status experimental <ACH>
F; 128-206/Domain: kringle homology <KR2>
F; 11-289/Domain: kringle homology <KR2>
F; 391-489/Domain: kringle homology <KR3>
F; 391-469/Domain: kringle homology <KR4>
F; 395-718/Domain: trypsin homology <KR4>
F; 495-718/Domain: trypsin homology <KR4>
F; 495-718/Domain: trypsin homology <KR4>
F; 32/Modified site: pyrrolidone carboxylic acid (Gln) (in mature form) #status experiment
F; 32/Modified site: pyrrolidone carboxylic acid (Gln) (covalent) #status predicted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           A;Status: preliminary

A;Description: stimulates mitosis of hepatocytes and other cells
A;Note: does not have proteinase activity
C;Superfamily: hepatocyte growth factor; kringle homology; trypsin homology
C;Reywords: alternative splicing; glycoprotein; growth factor; heterodimer; kringle;
F;1-32/Domain: signal sequence #status predicted <SIG>
F;16-495/Droduct: hepatocyte growth factor #status predicted <MAT>
F;56-495/Domain: hepatocyte growth factor alpha chain #status predicted <ACH>
F;129-207/Domain: kringle homology <KR1>
F;212-289/Domain: kringle homology <KR2>
F;306-384/Domain: kringle homology <KR3>
F;392-470/Domain: kringle homology <KR4>
F;496-728/Domain: kringle homology <KR4>
F;496-728/Domain: trypsin homology <KR4>
F;393-Modified site: pyrrolidone carboxylic acid (Gln) (in mature form) #status predicted
F;295,403,569,656/Binding site: carbohydrate (Asn) (covalent) #status predicted
F;488-607/Disulfide bonds: #status predicted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               R.Okajima, A.; Miyazawa, K.; Kitamura, N.
